Contents

This document contains 14 Figures (Figs. S1 – S14).
**Figure S1.** SST anomaly regression maps of internal Atlantic Multidecadal Variability (iAMV) in the 30-member GFDL-ESM2M Large Ensemble during (left) 1950-2020 and (right) 1950-2090. Panels a,b (e,f) show estimates based on the T&S (Residual) method; panels c,d show the true patterns (“Truth”). The number in the upper right of panels a,b and e,f denotes the pattern correlation coefficient with the true iAMV for the corresponding time period based on the domain 60°S-60°N (marked by dashed gray lines). Panels g and h show the forced (ensemble-mean) SSTA trends after subtracting the global-mean (60°S-60°N) forced SSTA trends. The color bar is unitless for panels a-f (°C per °C of the iAMV index) and in units of °C per 70 years for panel g and °C per 140 years for panel h. The number in the upper right of panels g,h denotes the pattern correlation coefficient with T&S for the corresponding time period. See main text for details.
Figure S2. As in Fig. S1 but for the 30-member CSIRO Large Ensemble.
Figure S3. As in Fig. S1 but for the 40-member CESM1 Large Ensemble.
Figure S4. As in Fig. S1 but for the 50-member CanESM2 Large Ensemble.
Figure S5. As in Fig. S1 but for the 50-member MIROC6 CMIP6 Large Ensemble.
Figure S6. As in Fig. S1 but for the 50-member CanESM5 Large Ensemble.
Figure S7. As in Fig. S1 but for the 30-member GFDL SPEAR_MED Large Ensemble.
Figure S8. As in Fig. S1 but for the 40-member CESM2 Large Ensemble.
Figure S9. SST anomaly regression maps of internal Atlantic Multidecadal Variability (iAMV) in the 100-member MPI Large Ensemble during (left) 1950-2020 and (right) 1950-2090. Panels a and b show results based on the Trenberth and Shea (2006; T&S) method of estimating iAMV; panels e and f show results based on the “Residual” method of estimating iAMV. Panels c and d show the true iAMV patterns (labeled “Truth”). Stippling indicates that the values are statistically significant at the 90% confidence level based on a 2-sided t-test. The number in the upper right shows the pattern correlation coefficient with the true iAMV for the corresponding time period based on the domain 60°S-60°N (marked by dashed gray lines). The color bar is unitless (°C per °C of the iAMV index).
Figure S10. Cumulative pattern correlation coefficients between iAMV SST anomaly regression maps computed over the North Atlantic domain (0°-60°N, 80°W-0°E) based on: T&S method vs. Truth (blue curves); Residual method vs. Truth (red curves); Forced trend vs. T&S method (cyan curves); Forced trend vs. Truth (green curves). Each analysis period begins in 1950 and ends in the year labeled along the x-axis (i.e., 2020 denotes the period 1950-2020, 2021 the period 1950-2021, etc.). Each panel shows a different model Large Ensemble, with the number of ensemble members indicated in parentheses (see Table S1).
Figure S11. As in Fig. S10 but based on the global domain (60°S-60°N) exclusive of the North Atlantic (0°-60°N, 80°W-0°E).
Figure S12  As in Fig. S10 but for cumulative spatial rms differences relative to the spatial rms of the true \textit{iAMV} regression map ("rmse") for each model Large Ensemble. Blue curves: T&S method vs. Truth; red curves: Residual method vs. Truth.
Figure S13. As in Fig. S11 but for cumulative spatial rms differences relative to the spatial rms of the true IAMV regression map (“rmse”) for each model Large Ensemble. Blue curves: T&S method vs. Truth; red curves: Residual method vs. Truth.
Figure S14. Cumulative pattern correlation coefficients between iAMV SST anomaly regression maps over the domain 60°S-60°N for 30-member subsets of the 100-member MPI Large Ensemble based on: T&S method vs. Truth (blue curves); Residual method vs. Truth (red curves); Forced trend vs. T&S method (cyan curves); Forced trend vs. Truth (green curves). The cumulative analysis periods begin in 1950 and end in the year labeled along the x-axis (i.e., 2020 denotes the period 1950-2020, 2021 the period 1950-2021, etc.). Members (a) 1-30; (b) 31-60; and (c) 61-90.
